## Reflection

### a) What we learned

- Learned more about database control and access
- Using the <div> element in html
- Google API
- Session control
- Passing variables through the html

### b) What was most challenging

- Adding books that work with the Google API
  - Multiple ISBN's we tried do not have a preview option with Google API (for instance, *The Call of the Wild*, which we included in our init\_db.sql).
- Formatting
  - Using divs and working with multiple columns was a challenge
  - Large amounts of css to keep track of
  - Mysterious errors involving div height and width
  - Google API would not display unless dimensions were properly specified

### c) What would we do differently

- Format the database and tables differently to allow for multiple book lists
- Make user\_homepage and friend\_homepage the same file
- Custom image for title borders
- Use Google API to browse and add books
- Improved css organization

### Team Member Evaluations
